
Using the JMS Palette

JMS Palette contains the activities for sending and receiving JMS messages that can be added to your business process.

Both the JMS point-to-point (queues) and publish/subscribe (topics) models are supported.

To add an activity to your project, you simply drag resources from the palette to the Process Editor.

With the exception of **Get JMS Queue Message**, all other activities support both messaging models. You can select the messaging model at design time when the activity is configured, or at runtime if, at design time, you chose Messaging Style to be "Generic".
