SSL Client Configuration for JMS - Advanced

Advanced configuration parameters:

- **Verify Host name:** This field specifies that the host name of the responder should be checked against the host name listed in the responder's digital certificate. This provides additional verification that the host name you believe you are connecting to is in fact the desired host. If the specified host name is not an exact match to the host name specified in the responder's digital certificate, the connection is refused.
- **Expected Host Name:** Specifies the name of the host you are expecting to connect to. This field is only available if the Verify Host Name field is checked. If the name of the host in the host's digital certificate does not match the value specified in this field, the connection is refused. This prevents hosts from attempting to impersonate the host you are expecting to connect to.
