Static Destinations

Static destinations are stored in the EMS configuration. The administrator can create or update static destinations by directly editing configuration files, by using the EMS Administration Tool or EMS Central Administration UI, or via custom programs implemented using administration APIs.

A static destination can be referenced in an application by creating a destination object reference to the queue or the topic. They can be referenced through a JNDI interface or through the creation of an application reference to a destination object using the (non-portable) `createQueue()` or `createTopic()` method of class `Session`.
