

JMS: Publish-Subscribe using Topics

Publish and Subscribe:

- Topic publishers address messages to a topic allowing a single sender to publish the same message to many receivers.
- Topic Subscribers subscribe to topics and receive messages on those topics.
- In ordinary publish and subscribe systems, message subscribers receive messages only when they are active.
- Durable subscriptions can receive messages when the subscriber is not active.
- Topics are configured and stored in a JNDI namespace.
- Available for clients through standard JNDI lookup.
