

JMS: Publish-Subscribe using Topics

In Publish/Subscribe message model:

- Topic *publishers* address messages to a topic allowing a single sender to publish the same message to many receivers
- Topic *subscribers* subscribe to topics and receive messages on those topics
- The same message may be received by many subscribers
- By default, message subscribers receive messages only when they are active
- A durable subscriber can receive messages published when the subscriber was not active
- Topics are configured and stored in a JNDI namespace, and available for clients through standard JNDI lookup
