## JMS Activities for Queue Processing

Generally, activities in TIBCO Business Studio JMS Palette can be used to send or receive messages from either a topic or a queue. The destination type is configured when the Messaging Style value is set in the activity's Properties > General tab. To work with a queue, set Messaging Style to **Queue**.

**Get JMS Queue Message** activity is an exception to this, as it is only available for queue processing.

**JMS Receive Message** is a process starter activity - it starts the BusinessWorks process when the message is received on the specified destination.

**JMS Send Message** is a synchronous activity - it blocks the process until it finishes.
