TIBCO BusinessWorks 6 and SSL

TIBCO EMS supports SSL communication with TIBCO BusinessWorks 6. You need to configure JMS Connection in SSL mode in TIBCO Business Studio.

First, you create a Keystore Provider Resource and import your keystore in JKS format. You then create an SSL Client Resource to define all properties of your SSL client connection, including a reference to your Keystore Provider Resource. Finally, you configure your JMS Connection for SSL mode by setting the Confidentiality flag to true and providing a reference to your SSL Client Resource.

If EMS server has enabled client authorization, then you enable and configure mutual authentication in your SSL Client configuration.
