JMS Activities for Topic Processing

The activities above can be used to send or receive messages from either a topic or a queue. To work with a topic, set Messaging Style value in the activity's Properties > General tab to **Topic**.

JMS Receive Message is a process starter activity - it starts a process when the message is received on the specified destination.

JMS Send Message is a synchronous activity - it blocks the process until it finishes.

Wait for JMS Request is a signal-in activity which waits for a message for the specified JMS topic.

JMS Request Reply and **Reply to JMS Message** activities are used to implement a JMS application's request-response service. The request is sent to a JMS destination and then the activity waits on the response from the application that received the request.
