Message Compression

Message compression is especially useful for large messages which will be stored on the server - for persistent queue messages, or topics with durable subscribers. Message compression ensures that messages will take less memory space in storage on the server.

The compressed messages are handled by the client in their compressed form.

The compression option only compresses the body of a message. Headers and properties are never compressed.

Message compression is specified for individual messages. EMS does not define a way to set message compression at the per-topic or per-queue level.
